IEC Motor Mechanical Design

Frame Construction

- Modern totally enclosed squirrel cage motors are available in a choice of aluminum, steel and cast iron frames for different application areas.
- Available frame materials for ABB motors are cast iron and aluminium.

Frame Size

- The height of shaft center point in relation to the surface of the ground (typically measured in mm).
- Common IEC frame sizes for LV motors are 56, 63, 71, 80, 90, 100, 112, 132, 160, 180, 200, 225, 250, 280, 315, 355, 400 and 450.

Mounting Arrangements

	Code I/Code II					
Foot-mounted motor	IM B3 IM 1001	IM V5 IM 1011	IM V6 IM 1031	IM B6 IM 1051	IM B7 IM 1061	IM B8 IM 1071

						M000012

- There are Code I and Code II for motor mounting arrangements. Marked *) means it's not specified in IEC 60034-7.
- Mounting arrangement is very important to manufacturer as there might have some special consideration required especially for vertical mounted motors (eg: V3, V6, V1....)
- Special end shield or seals is required for those shaft upwards where water/liquid are expected to go down along the shaft.

Vibration

- Vibration according to Grade A is applied to ABB motors as standard.
- The vibration measurement is performed for all motors and generators according to IEC 60034-14.
- Grade B vibration level is available upon request.

Vibration Grade	Shaft height	$56 < H \leq 132$	$132 < H \leq 280$	$H > 280$
	mm mounting	Velocity mm/s	Velocity mm/s	Velocity mm/s
A	Free suspension	1,6	2,2	2,8

Vibration Grade	Shaft height	$56 < H \leq 132$	$132 < H \leq 280$	$H > 280$
	mm mounting	Velocity mm/s	Velocity mm/s	Velocity mm/s
B	Free suspension	0,7	1,1	1,8

Starting Type

D.O.L. starting

Y/Δ starting

Current

Torque

Insulated Bearings and Filters

- Use of non-suitable bearings, the surfaces of rolling elements and raceways in the bearing might be damaged and degrade the grease rapidly (electric erosion). This is all due to common shaft current from converter supply.
- Bearing voltages and currents must be avoided with insulated bearings (VC+701) and/or properly dimensioned filters at the converter must be used as shown in guideline table below:-

Nominal power P_N and/or IEC frame size	Preventive measures
$P_N < 100 \text{ kW}$	No actions needed
$P_N \geq 100 \text{ kW}$ OR $\text{IEC } 315 \leq \text{Frame size} \leq \text{IEC } 355$	Insulated non-drive end bearing (VC+701)
$P_N \geq 350 \text{ kW}$ OR $\text{IEC } 400 \leq \text{Frame size} \leq \text{IEC } 450$	Insulated non-drive end bearing (VC+701) AND Common mode filter at the converter

Sample Damages of Shaft Current to Conventional Bearings

**Bearing Raceways Damaged
with more Losses, Noises, Heats and
Motor might be Jammed. Money wasted
for wrong bearing replacement.**

Analisa Vibrasi

- Dominan Vertical
 - Pondasi (Karatan, Dudukan Lemah, Pondasi melengkung, Baut Kendor)

Analisa Vibrasi

- Dominan Horisontal
 - Unbalanced Bearing
 - Housing Bearing
 - Kotoran Pada Bearing

Analisa Vibrasi

- Dominan Axial
 - Miss Alaiement
 - Housing Bearing
 - Sleeve Bearing

Analisa Vibrasi

- Dominan Axial, Horizontal, Vertical
 - Shaft Bengkok
 - Pondasi Melengkung

Greasing

- Menggunakan alat vibrotip jika nilai dBm bernilai “-” berarti bearing masih bagus, namun apabila vibrotip menunjukkan nilai dBm “+” berarti bearing luka. Apabila nilai dBm sudah > dari 25 maka perlu dipersiapkan spare pengganti bearing. Namun apabila nilai dBm > 35 maka bearing harus diganti karena dapat merusak housing bearing.
- D.2. DBCarpet (dBc)
- Untuk menganalisa pelumasan bearing (dBm – dBc)
- Apabila nilai dBm – dBc >10 maka bearing kekurangan pelumas
- Apabila nilai dBm – dBc <10 maka bearing kelebihan pelumas
- Apabila nilai dBm – dBc =10 maka bearing stabil

Flame Proof enclosed Ex d

1. Ketika motor panas, Udara didalam motor keluar ketika motor dingin , udara luar masuk ke motor
2. Boleh ada ledakan didalam
3. Dapat menahan tekanan ledakan
4. Karena dapat menahan tekanan ledakan maka tidak boleh retak
5. Ledakan yang keluar harus dingin
6. Untuk melapisi logam, jangan gunakan vaseline atau grease karena mengandung minyak tapi gunakanlah non setting grease

Flame Proof enclosed Ex e

1. Body motor Ex e harus < 11 Kw
2. Ukur air gap pada rotor dan stator
3. Ukuran dan jarak terminal harus sesuai standar 60079-7
4. Pengencangan kabel ke terminal harus kencang (no slip)
5. Tidak boleh ada ledakan
6. Banyak sensor
7. Minimum IP 54
8. Aplikasi dibawah 1000 V dapat direwending > 1000 V
Harus rewending pabrik pembuat
9. Harus ada internal temperature

Pengecekan motor baru

1. Saat Motor datang periksa kelengkapan sertifikat ex baik dari vendor maupun dari pabrik pembuat
2. Catat semua data persis yang tertera di name plate motor
3. Isi kolom data motor dan hasil pengukuran nilai megger dan resistansi motor
4. Apabila ditemukan hal yang tidak standar harap dikembalikan ke penyuplai (>1 tahun garansi ada pada pihak penerima)
5. Apabila hasil pengukuran sudah sesuai, test motor run dan catat hasil pengukurannya. Jika ada yang abnormal harap dikembalikan ke penyuplai

Visual Check

1. Saat Motor datang periksa juga kondisi motor apakah ada retak, patah ataupun bending.
2. Pemeriksaan bersifat all mulai dari coupling, pondasi, pompa hingga motor
3. Apabila ditemukan hal yang tidak sesuai harap segera dilaporkan ke penyuplai

General Remarks :

Checked By		Witness By		Inspected By		Remarks
Company	Signature	Company	Signature	Company	Signature	

Perbaikan

Saat motor sudah running ataupun sudah diterima pihak store > 1thn dan diketemukan hal yang tidak standar sehingga memerlukan pembongkaran maka lakukan hal sbb :

1. Periksa sertifikat untuk motor >1thn. Untuk motor yang sudah running harap check data awal saat commisioning (nilai megger dan nilai resistance). Periksa pula tahun pembuatan motor tersebut .

$$\text{Megger}_{\text{U-V-W}} = \frac{20 \times \text{Vac}}{1000 + (2 \times \text{kw})} \geq 6.06 \text{ Mohm}$$

$$\text{Megger}_{\text{U-V-W-G}} \geq 10 \text{ Mohm}$$

$$\text{Ohm meter} \leq 0.5 \text{ ohm}$$

Perbaikan

2. Sebelum melakukan pembongkaran ukur dan marking semua (coupling, flange)
Ukur pula jarak air clearance antara fan cover dengan fan. Marking pula lubang baut untuk cover fan.

3. Bersihkan as rotor dan gunakan penetrating oil di depan dan di lubang pengunci kopling. Diamkan sesaat dan beri grease pada as motor

4. Gunakan tracker / Puller untuk melepas coupling

Perbaikan

5. Lepas tutup kipas dan lepas kipas dengan menggunakan tracker yang sesuai.

6. Lepas Baut pada tutup motor Belakang (NDE) dan biarkan tutup motor depan (DE) masih terbaut .gunakan puller untuk membuka tutup belakang dahulu.

Perbaikan

7. Setelah tutup belakang terbuka, lepas baut tutup depan dan keluarkan rotor bersama tutup depan.

8. Ukur free volume box terminal dengan cara mengukur box terminal. sebelumnya bersihkan terlebih dahulu baru ukur volume box terminal. Untuk circular perlu diukur diameter dan tinggi. Sedangkan untuk rectangular Box perlu diukur panjang x lebar x tinggi.

X

X 0.785 X

= Circular Box

Diameter

X

Diameter

X

Phi

X

Tinggi

Rectangular box		Circular box			
terminal box internal width 'w' cm	N/A	cm.	Circular box width	N/A	cm.
terminal box internal breadth 'br' cm	N/A	cm.	Circular box depth	N/A	cm.
terminal box internal height 'h' cm	N/A	cm.	or Circular terminal box free volume V4 = 0.785wxwxh cm ³	#VALUE!	cm ³ .
terminal box free volume V3 = (wxbxh) cm ³	#VALUE!	cm ³ .			

Confirm volume column used for terminal box from the standards on report form

V ≤ 100: ☐ 100 < V ≤ 500: ☐ 500 < V ≤ 2000: ☐ V > 2000: ☐

Rectangular Box =

Tinggi

X

Panjang

X

Lebar

8. Apabila free volume sudah didapatkan, ukur length flame path (bersihkan korosi sebelum mengukur) dan check gas group pada motor untuk mengecek maximum gap pada flamepath apakah masih diperbolehkan untuk diperbaiki.

1. Motor frame inner dia "a" cm adalah diameter dalam motor ukur menggunakan caliper contoh : 13,4 cm
2. Motor core length "b" cm adalah volume rotor ukur menggunakan caliper contoh : 14,5 cm
3. Motor frame length "f" cm between endshield adalah panjang motor dari frame depan (DE) hingga frame belakang (NDE) contoh 34 cm

1

2

3

Free Volume Calculations: FRAME

Motor body / Frame / Stator :		
motor frame inner diameter 'a' cm	N/A	cm.
motor core length 'b' cm	N/A	cm.
motor frame length 'f' cm between endshields b over f	N/A	cm.
	#VALUE!	
Reduction factor R to be		
Frame free volume V1 = $0.785 \times a \times (f - b) \times R$ cm ³	#VALUE!	cm ³ .

Lead Connection Chamber:		
Width	N/A	cm.
Breadth	N/A	cm.
Height	N/A	cm.
V2	#VALUE!	cm ³ .
Total stator free volume = (V1 + V2) cm ³	#VALUE!	cm ³ .

Confirm volume column used for stator from the standards on report form:

V <= 100:

☐

100 < V <= 500:

☐

500 < V <= 2000:

☐

V > 2000:

☐

TERMINAL BOX (volume calculation not required for EEx de)

4. Hitung nilai b/f (0,426) kemudian masukkan ke tabel volume reduction factor R didapat hasil 0,404

5. Hitung free volume dengan rumus $0.7865 \cdot a \cdot a \cdot (f-b) \cdot R = 1.110 \text{ cm}^3$ ($500 < V < 2000$)

6. Check di nameplate motor proteksi yang digunakan contoh IIB

7. Ukurlah length flame path misal didapat nilai 30,42 mm

8. Tentukan flamepath tersebut termasuk rolling element bearing atau flange. Contoh flange

Table 1 – Minimum width of joint and maximum gap for enclosures of Groups I, IIA and IIB

Type of joint		Minimum width of joint <i>L</i> mm	Maximum gap mm											
			For a volume cm ³ <i>V</i> ≤ 100			For a volume cm ³ 100 < <i>V</i> ≤ 500			For a volume cm ³ 500 < <i>V</i> ≤ 2 000			For a volume cm ³ <i>V</i> > 2 000

		40	0,80	0,75	0,60	0,80	0,75	0,45	0,80	0,75	0,45	0,80	0,75	0,40

NOTE Constructional values rounded according to ISO 31-0 should be taken when determining the maximum gap.

10. Ukur semua gap pada flamepathGap yang diperbolehkan adalah < 0.20 . Apabila ada luka atau nilai flamepath sudah diatas 0.20 maka motor tidak dapat diperbaiki dan harus down grade ke non ex
12. Gap didapatkan dengan mengukur diameter luar – diameter dalam. Apabila Gap $<$ standar gap maka motor masih bisa digunakan dan tidak diperlukan reclaiment

11. Untuk motor yang masih bisa diperbaiki bisa dibongkar dan dilakukan penggantian bearing atau rewinding.

12. Gunakan puller untuk melepas bearing

13. Gunakan heater untuk pasang bearing kembali

14. Masukkan rotor kedalam stator sesuai marker yang kita buat awal

15. Kencangkan semua baut sesuai torsi yang diijinkan
